# **SQL Basics Cheat Sheet**

. . .

. . .

**SQL**, or *Structured Query Language*, is a language to talk to databases. It allows you to select specific data and to build complex reports. Today, SQL is a universal language of data. It is used in practically all technologies that process data.

#### **SAMPLE DATA**

... ...

COUN	TRY						
id	nar	ne	рори	ulation		area	
1	Fran	France		66600000		640680	
2	Germ	any	807	700000		357000	
		•				•••	
СІТҮ							
id	name	count	ry_id	populatio	on	rating	
1	Paris		1	2243000		5	
2	Berlin		2	3460000		3	

## **QUERYING SINGLE TABLE**

Fetch all columns from the country table: SELECT \* FROM country;

Fetch id and name columns from the city table: SELECT id, name FROM city;

Fetch city names sorted by the rating column in the default
ASCending order:
SELECT name
FROM city
ORDER BY rating [ASC];

Fetch city names sorted by the rating column in the DESCending order: SELECT name FROM city ORDER BY rating DESC;

## ALIASES

COLUMNS

SELECT name AS city\_name
FROM city;

#### TABLES

SELECT co.name, ci.name FROM city AS ci JOIN country AS co ON ci.country\_id = co.id;

## FILTERING THE OUTPUT

#### **COMPARISON OPERATORS**

Fetch names of cities that have a rating above 3: SELECT name FROM city WHERE rating > 3;

Fetch names of cities that are neither Berlin nor Madrid: SELECT name FROM city WHERE name != 'Berlin' AND name != 'Madrid';

#### **TEXT OPERATORS**

Fetch names of cities that start with a 'P' or end with an 's':
SELECT name
FROM city
WHERE name LIKE 'P%'
OR name LIKE '%s';

Fetch names of cities that start with any letter followed by 'ublin'
(like Dublin in Ireland or Lublin in Poland):
SELECT name
FROM city
WHERE name LIKE '\_ublin';

#### **OTHER OPERATORS**

Fetch names of cities that have a population between 500K and 5M: SELECT name FROM city

WHERE population BETWEEN 500000 AND 5000000;

Fetch names of cities that don't miss a rating value: SELECT name FROM city WHERE rating IS NOT NULL;

Fetch names of cities that are in countries with IDs 1, 4, 7, or 8: SELECT name FROM city WHERE country\_id IN (1, 4, 7, 8);

## **QUERYING MULTIPLE TABLES**

#### **INNER JOIN**

JOIN (or explicitly INNER JOIN) returns rows that have matching values in both tables. SELECT city.name, country.name FROM city [INNER] JOIN country ON city.country\_id = country.id; CITY COUNTRY id name country id name

id	name	country_id	id	name
1	Paris	1	1	France
2	Berlin	2	2	Germany
3	Warsaw	4	3	Iceland

## LEFT JOIN

LEFT JOIN returns all rows from the left table with corresponding rows from the right table. If there's no matching row, NULLs are returned as values from the second table. SELECT city.name, country.name

#### FROM city

LEFT JOIN country

ON	city.country_id = country.id;					
CITY			COUNTRY			
id	name	country_id	id	name		
1	Paris	1	1	France		
2	Berlin	2	2	Germany		
3	Warsaw	4	NULL	NULL		

#### **RIGHT JOIN**

RIGHT JOIN returns all rows from the right table with corresponding rows from the left table. If there's no matching row, NULLs are returned as values from the left table. SELECT city.name, country.name FROM city

**RIGHT JOIN** country

ON city.country\_id = country.id;

CITY		COUNT	COUNTRY		
id	name	country_id	id	name	
1	Paris	1	1	France	
2	Berlin	2	2	Germany	
NULL	NULL	NULL	3	Iceland	

#### **FULL JOIN**

FULL JOIN (or explicitly FULL OUTER JOIN) returns all rows from both tables - if there's no matching row in the second table, NULLs are returned. SELECT city.name, country.name FROM city FULL [OUTER] JOIN country ON city.country\_id = country.id; CITY COUNTRY

LearnSOI

CITY			COUNTRY	
id	name	country_id	id	name
1	Paris	1	1	France
2	Berlin	2	2	Germany
3	Warsaw	4	NULL	NULL
NULL	NULL	NULL	3	Iceland

#### **CROSS JOIN**

CROSS JOIN returns all possible combinations of rows from both tables. There are two syntaxes available. SELECT city.name, country.name FROM city CROSS JOIN country;

SELECT city.name, country.name
FROM city, country;

CITY			COUNT	RY
id	name	country_id	id	name
1	Paris	1	1	France
1	Paris	1	2	Germany
2	Berlin	2	1	France
2	Berlin	2	2	Germany

#### **NATURAL JOIN**

**NATURAL JOIN** will join tables by all columns with the same name.

SELECT city.name, country.name FROM city

NATORAL JOIN COUNCIY,							
CITY	COUNTRY						
country_id i		name name		id			
6	6	San Marino	San Marino	6			
7	7	Vatican City	Vatican City	7			
5	9	Greece	Greece	9			
10	11	Monaco	Monaco	10			

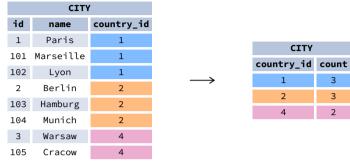

NATURAL JOIN used these columns to match rows: city.id, city.name, country.id, country.name. NATURAL JOIN is very rarely used in practice.

## **SQL Basics Cheat Sheet**

### AGGREGATION AND GROUPING

GROUP BY groups together rows that have the same values in specified columns. It computes summaries (aggregates) for each unique combination of values.

#### **AGGREGATE FUNCTIONS**

- avg(expr) average value for rows within the group
- count (expr) count of values for rows within the group
- max(expr) maximum value within the group
- min(expr) minimum value within the group
- sum(expr) sum of values within the group

#### **EXAMPLE OUERIES**

Find out the number of cities: SELECT COUNT(\*) FROM city;

Find out the number of cities with non-null ratings: SELECT COUNT(rating) FROM city;

Find out the number of distinctive country values: SELECT COUNT(DISTINCT country\_id) FROM city;

Find out the smallest and the greatest country populations: SELECT MIN(population), MAX(population) FROM country;

Find out the total population of cities in respective countries: SELECT country\_id, SUM(population) FROM city GROUP BY country\_id;

Find out the average rating for cities in respective countries if the average is above 3.0: SELECT country\_id, AVG(rating) FROM city GROUP BY country\_id HAVING AVG(rating) > 3.0;

## **SUBOUERIES**

A subguery is a guery that is nested inside another guery, or inside another subguery. There are different types of subqueries.

#### SINGLE VALUE

The simplest subquery returns exactly one column and exactly one row. It can be used with comparison operators =, <, <=, >, or >=. This query finds cities with the same rating as Paris: SELECT name FROM city WHERE rating = (

SELECT rating

FROM city WHERE name = 'Paris'

);

3

3

2

#### **MULTIPLE VALUES**

A subquery can also return multiple columns or multiple rows. Such subqueries can be used with operators IN, EXISTS, ALL, or ANY. This guery finds cities in countries that have a population above 20M: SELECT name FROM citv WHERE country\_id IN ( SELECT country\_id FROM country WHERE population > 20000000 );

#### CORRELATED

A correlated subquery refers to the tables introduced in the outer query. A correlated subquery depends on the outer query. It cannot be run independently from the outer auerv. This query finds cities with a population greater than the average population in the country: SELECT \* FROM city main\_city WHERE population > ( SELECT AVG(population) FROM city average\_city WHERE average\_city.country\_id = main\_city.country\_id );

This query finds countries that have at least one city: SELECT name FROM country WHERE EXISTS ( SELECT \* FROM city WHERE country\_id = country.id );

### SET OPERATIONS

Set operations are used to combine the results of two or more queries into a single result. The combined gueries must return the same number of columns and compatible data types. The names of the corresponding columns can be different.

CYCLING			SKATING		
id	name	country	id	name	country
1	YK	DE	1	YK	DE
2	ZG	DE	2	DF	DE
3	WT	PL	3	AK	PL

#### UNION

**UNION** combines the results of two result sets and removes duplicates. **UNION** ALL doesn't remove duplicate rows.

This query displays German cyclists together with German skaters: **SELECT** name **FROM** cycling WHERE country = 'DE' UNION / UNION ALL **SELECT** name **FROM** skating WHERE country = 'DE';

#### **INTERSECT**

**INTERSECT** returns only rows that appear in both result sets.

This guery displays German cyclists who are also German skaters at the same time: **SELECT** name **FROM** cycling WHERE country = 'DE' INTERSECT **SELECT** name **FROM** skating WHERE country = 'DE';

#### **EXCEPT**

EXCEPT returns only the rows that appear in the first result set but do not appear in the second result set.

This query displays German cyclists unless they are also German skaters at the same time:

**SELECT** name **FROM** cycling WHERE country = 'DE' **EXCEPT / MINUS SELECT** name **FROM** skating WHERE country = 'DE';
